ABSTRACT

This plant is characterised in that the water filtering device with its motor pump, the device for chemically treating said water, the pipes with the corresponding valves and with the openings for receiving the water from the swimming pool and for returning the cleaned and treated water to said swimming pool, and the corresponding accessories are all of them connected and installed on a base framework allowing to transport the whole ready-to-operate plant to the site having been chosen for it. All of the components making up this plant can be distributed in independent modules being apt to be fitted to each other. The assembly being made up of all of the components and accessories of the plant, both if they are installed on a single base framework as well as if they are distributed in modules, is of such dimensions as to be apt to be put in a conventional container facilitating its transportation.

A swimming pool water treatment plant.

BACKGROUND OF THE INVENTION

As is well known, swimming pool water must be
5 periodically cleaned of impurities and small debris by
passing it through a filter, said water also needing to
be disinfected and for such a purpose being submitted to
a chemical treatment being generally carried out with
chlorine.

10 This requires a facility being erected "in situ" and
comprising the filter and the corresponding motor pump,
the reservoir with proportioner for the disinfectant,
this latter generally being chlorine, and the
corresponding pipes and valves and other accessories, the
15 erection of said facility requiring much space and being
labour intensive for an operative facility of this kind.

SUMMARY OF THE INVENTION

This invention has as its object a swimming pool
water cleaning and treating plant comprising all of the
20 necessary apparatuses and devices duly provided with
their accessories for carrying out said functions, all
said components being as a whole installed and secured
onto a base framework supporting them, all of said
components being conveniently connected and arranged so
25 as to be employable anywhere and at any time, the plant
for such a purpose only occupying a very small space and
being therefore apt to be put in a conventional container
and to thus and through the use of any transportation
means be easily transported to its place of destination
30 where upon its arrival it is already in a position to be
connected to the swimming pool and to the mains for
immediate operation.

On top of these advantages the plant incorporates as
well notable improvements both as regards the filtering

devices and the means being used for chemically treating the water.

The filtering devices comprise a silica filter from which the water passes to a diatomaceous earth filter and
5 thus comes out much clearer and having an enhanced quality.

The means being used for chemically treating the water do on the other hand comprise the use of ozone as a viricide deploying its action when confronted with
10 bacteria and fungi and giving the water a nice blue colour, and of bromine as an oxidant not producing odours or inert, nitrogenised derivatives, although another halogen could also be used as a disinfectant.

This plant will also comprise the corresponding
15 drive and control panel as well as a buffer vessel being provided to receive the swimming pool water, and an acid proportioner.

The container or the framework supporting the plant cannot in some cases gain access to the site where said
20 plant has to be installed, this being due to the narrow dimensions of the passage leading to said site.

In order to solve this problem the framework has been divided into several modules each comprising a part of the plant's devices and of their accessories, the
25 modules being hence in a position to pass through those places previously not allowing the passage of the whole plant.

This division of the plant into modules does as well allow to facilitate its storage, and in some cases also
30 facilitates its transportation to the site.

These independent modules are apt to be fitted to each other, the connections between them being apt to be carried out at the site where the plant is to be installed, the components being installed in each module
35 for such a purpose comprising their particularised

connections in correspondence with the connections of the components of the module to which said each module has to be fitted, a possibly wrong connection between the different components of the plant being thus precluded.

5 Once having been fitted to each other the modules do advantageously occupy a rectangular space corresponding to the dimensions of the base of a conventional container.

10 In a preferential instance the plant will be installed in five modules each of them for example basically comprising: a silica filter and the chemical proportioner; the drive and control panel, and the acid proportioner with the chemical reservoir; a diatomaceous earth filter with its charger-store; the contact chamber
15 and the ozone destructor; and the buffer tank.

 These and other characteristics will be best made apparent by the following detailed description whose understanding will be made easier by the accompanying five sheets of drawings showing practical embodiments
20 being cited only by way of example not limiting the scope of the present invention.

DESCRIPTION OF THE DRAWINGS

 In the drawings:

25 Figs. 1, 2 and 3 in a plan-view, in a front elevation and in a side elevation (at a larger scale) respectively represent the plant being the object of the invention;

 Figs. 4 and 5 respectively represent a modular diagram and an installation diagram corresponding to a
30 basic plant; and

 Figs. 6 and 7 respectively represent a modular diagram and an installation diagram corresponding to a more fully equipped plant.

DETAILED DESCRIPTION

The plant comprises a buffer vessel or tank 1 being provided to receive the water from the swimming pool; the water being conveyed by means of the motor pump 2 and through the prefilter 3 and the pipe 4 towards the
5 horizontally arranged silica filter 5. The water filtration is complemented with the ulterior passage of the water through a diatomaceous earth filter 6 being connected to a diatomaceous earth charger-store 7.

The water is chemically treated with ozone being
10 generated in the drive and control panel 8, and with bromine or another disinfectant from the proportioner 9, and is thereupon returned to the swimming pool through the opening 10 of pipe 11.

The plant is completed with the acid proportioner 12
15 and the chemical reservoir 13.

The plant does furthermore comprise the contact chamber 14, the ozone destructor 14', the motor pump 15 with prefilter 16 for pumping the water to the diatomaceous earth filter 6, and the corresponding manual
20 or automated valves 17 for governing the water circulation.

On top of the motor pump 2 with its prefilter 3, and of the motor pump 15 with its prefilter 16 other motor pumps 2' and 15' with their prefilters 3' and 16' have
25 been foreseen for optional operation.

Numeral 18 indicates the overflow of the buffer vessel 1; numeral 19 indicates the drain outlet; and numeral 20 indicates an accessory inlet being provided for the suction of swimming pool water whenever
30 necessary.

This whole plant is arranged and secured onto a base framework 21, the assembly being made up of said apparatuses and devices with their accessories determining a volume as per a prism having a rectangular
35 base of adequate dimensions (650 x 250 x 210 cm) allowing

to put it in a conventional container for its transportation through any means.

According to Fig. 4 the basic plant for the treatment of swimming pool water comprises the following modules with the corresponding plant components: module M1 corresponding to the silica filter area; module M2 corresponding to the drive and control panel, acid proportioner unit and motor pump area; modules M3 and M4 corresponding to the buffer tanks being possibly provided in varying numbers as required by the swimming pool in question.

According to Fig. 5 this basic plant comprises in the installation: buffer tanks De, recirculating pump B, five-valve manual battery BT, silica filter F, Cl/Br proportioner D, pH proportioner P, and water/water exchanger I.

This basic plant can be automated by arranging the filter battery in a motorised arrangement allowing to automatically carry out all functions such as the filtering, washing, rinsing, emptying and other functions intervening in the swimming pool water treatment.

According to Fig. 6 the fully equipped plant has the following modular distribution: module M1' comprising the silica filter and valve battery, module M2' comprising the electrical drive and control panel, module M5 corresponding to the pump area (silica and diatomaceous earth filtration and ozone treatment), module M6 comprising the contact chamber and ozone destruction unit, and modules M3' and M4' corresponding to buffer tanks.

According to Fig. 7 this fully equipped plant comprises the following installation: buffer tanks D'e, recirculating pumps B', motorised valve battery BT', silica filter F', diatomaceous earth filter pump BDI, filter with charger/cleaner and diatomaceous earth store

DI, ozone pump BO, ozone generator system with reflux system and intelligent destructor DO, Cl/Br proportioner D', pH proportioner P', and heater C.

5 The buffer tanks will preferably be independent, although they could also form a monobloc assembly.

All plants will have a drain outlet and will be apt to be connected to a computer. They will be as well possibly provided with wheels facilitating their transportation, said wheels preferably being retractable.

10 The invention can within its essentiality be put into practice in other embodiments only in detail differing from those having been set forth only by way of example, said other embodiments also falling within the scope of the protection being sought. This plant can
15 hence be carried out with the best suited means, apparatuses, components and accessories, all this falling within the scope of the appended claims.

CLAIMS

1. A swimming pool water treatment plant being characterised in that it comprises the water filtering device with its motor pump (2), the device for chemically
5 treating said water, the pipes with the corresponding valves (17) and with the openings for receiving the water from the swimming pool and for returning (10) the cleaned and treated water to said swimming pool, and the corresponding accessories, all this being connected and
10 installed on a base framework (21) allowing to transport the ready-to-operate plant to the site having been chosen for it.

2. A swimming pool water treatment plant as per claim 1, characterised in that the water filtering device
15 comprises a silica filter (5) from which the water passes to a diatomaceous earth filter (6).

3. A swimming pool water treatment plant as per claim 1, characterised in that the water chemical treatment comprises the application of ozone and of a
20 disinfectant such as a halogen.

4. A swimming pool water treatment plant as per claim 1, characterised in that it comprises a drive and control panel (8).

5. A swimming pool water treatment plant as per
25 claim 1, characterised in that it comprises a buffer vessel (1) being provided to receive the water from the swimming pool.

6. A swimming pool water treatment plant as per claim 1, characterised in that it comprises an acid
30 proportioner (12).

7. A swimming pool water treatment plant as per claim 2, characterised in that the diatomaceous earth filter (6) is connected to a diatomaceous earth charger-store (7).

8. A swimming pool water treatment plant as per the preceding claims, characterised in that the assembly being made up of all its components and accessories is of such dimensions as to be apt to be put in a conventional container facilitating its transportation.

9. A swimming pool water treatment plant as per claim 1, characterised in that all of the components making up the plant are distributed in independent modules (M) being apt to be fitted to each other.

10. A swimming pool water treatment plant as per claim 9, characterised in that the components of each module (M) comprise connections being particularised in correspondence with those of the components of the module (M) to which they must be fitted.

11. A swimming pool water treatment plant as per claim 9, characterised in that the assembly being made up of the modules (M) having been fitted together is of such dimensions as to be apt to be put in a conventional container.
